According to this view the above theorem in plane trigonometry relates to the addition of arcs, but to the product of angles. Let - denote the axis of the constant plane, then (1) takes the form cos aAa = cos aA+B = cos A cos B--sin A sin B, and (2) takes the form sin aAa = sin aA+B = cos A sin B + cos B sin A. We may also view A as denoting twice the area of the circular sector, the radius being unity; and this view of the notation is important, for it applies to the equilateral hyperbola, while the former view does not. An angle which is the negative of a given angle has an equal arc, but the opposite axis; (---) is the negative of aA. The minus may. be removed from the base and attached to the index; thus (---)A = aA, and aA--a)B = aAB. So long as the axis remains the same or the opposite, the arcs are combined like ordinary indices. But suppose that a different axis /? is introduced, it is evident that then the rule for indices must be generalized. The V--1 in the ordinary complex quantity denotes an angle whose arc is a quadrant, but it leaves the axis of the plane unspecified. The angle aA is a quaternion with unity for ratio;...
