Now the tangent at A, taken twice over, mny be regarded as a conic having four-pointic contact at A; whence it appears that the point M is the second tangential of A. The number of conies of the system which touch the cubic at some other point is therefore the number of tangents that can be drawn from M to the curve; that is, four in general, two when the cubic has a node, and one when it has a cusp. But in this number there is always included that conic which is made up of the tangent at A taken twice over; and this is not a proper solution. Theoem Concerning Five Points On A Circle.
